Generator Name: _____ Profile Number: _____

To the best of my knowledge and ability to determine, the constituents of the waste as profiled does not contain materials of medical origin as follows:

1. Cultures and stocks of infectious agents and associated biologicals.
2. Laboratory wastes that were in contact with infectious agents.
3. Pathological wastes, including human or animal tissue contaminated with infectious agents.
4. Waste materials from the rooms of human or animal enclosures that are likely to transmit infectious agents.
5. Human blood and blood products. Blood products does not include patient care waste such as bandages, disposable gowns that are lightly soiled with blood or other body fluids unless such wastes are soiled and the generator determines they should be managed as infectious waste.
6. Used sharps (e.g. syringes, needles, and surgical blades) used in the treatment or inoculation of humans or animals or if they have come in contact with infectious agents.
7. Contaminated animal carcasses, body parts or bedding that were intentionally exposed to infectious agents which may present a substantial threat to public health.

This information is accurate and I have made no deliberate or willful omissions in regard to the composition of this waste in preparing this document.

Generator's Authorized Signature: _____ Date: _____
